Excerpt: . . . they should prove of value to those who expect to plant mangoes for sale or for home use. Over 40 varieties which have not yet fruited will be discussed in subsequent reports. SOIL. Porto Rico has a very wide range of soil types, a given type, however, occurring in only small areas in any section. As the mango tree is found in abundance in almost all parts of Porto Rico, the quality of soil in which it is planted seems to be an unimportant factor in its growth, provided the depth of the soil is considerable. A shallow soil underlain with stone or hardpan, although sufficiently deep to produce shrubs or other low-growing wild vegetation, will not satisfy the needs of the deep-rooted mango, whose growth in such ground will be slow and its yield poor, at least after the first few years. The application of fertilizers, however, will materially decrease the depth of soil required. While the mango is less affected by the quality of the soil than many other fruit trees, it is sensitive to an overabundance of soil moisture. It is never vigorous or prolific in low, poorly drained lands or on higher planes where the water level is near the surface throughout long periods. Where subdrainage is poor, the vigorous roots which penetrate to some depth during a dry season are always severely injured if not killed by the excess of water during the period of heavy rains lasting for...
